

EDWARDS PLATEAU · CAPROCK BREAKS INTO A LIVE-OAK RAVINE

The Cut *Pavilion*

A long limestone wall holds the plateau edge; a timber-clad hall lifts off it and reaches out over the shaded creek. You pass through a **single slot in the wall** — from open heat into cool filtered shade, held above the water.

The Wall

A 220-foot solid Lueders limestone wall runs east–west along the caprock edge. The datum, the sun-stop, the horizon. The plateau made vertical.

The Reach

The hall and its single-pitch white-oak roof cantilever north off the wall, hovering thirty feet over the ravine on one row of piers. Sky and shade.

The Slot

One full-height vertical cut through the wall — the only way in. The hinge between hot and open, cool and held.
