

Fonts — one required step before the brand renders true everywhere

What's already true: the app makes **no runtime network font fetch**. The three `fonts.googleapis.com` `<link>` tags that used to sit in `src/view.js` and `src/routes/auth-routes.js` are removed. The app never blocks on, or falls back because of, an unreachable Google.

What still needs one step: the twelve `woff2` font files are **not** included in this repo (they are binary and could not be committed as part of the build). The `@font-face` rules at the top of `public/design-tokens.css` are `local()`-first and then point at `url('fonts/...woff2')` **in this directory** — but those files aren't here yet. Until you add them:

- a machine that already has these OFL faces installed renders true (via `local()`);
- a **fresh/offline server** that has neither the faces installed nor these files will render the Spiti wordmark and headings in a **system serif/sans fallback**, not Cormorant Garamond.

So this is a real "do this once before you go live" step, not a done deal. It is easy.

Add the twelve files

Place these exact filenames here (they must match the `url('fonts/...woff2')` sources in `design-tokens.css`):

```
cormorant-garamond-300.woff2
cormorant-garamond-400.woff2
cormorant-garamond-500.woff2
cormorant-garamond-300italic.woff2
cormorant-garamond-400italic.woff2
inter-400.woff2
inter-500.woff2
inter-600.woff2
newsreader-400.woff2
newsreader-400italic.woff2
ibm-plex-mono-400.woff2
ibm-plex-mono-500.woff2
```

Easiest way (no design tools needed)

1. Go to **gwfh.mranftl.com** (google-webfonts-helper — a free site that hands you ready-made `woff2` files for any Google font).
2. Search each family in turn: **Cormorant Garamond**, **Inter**, **Newsreader**, **IBM Plex Mono**. Tick the weights/styles listed above, download, and you get `woff2` files.
3. Rename each downloaded file to the matching name in the list above, and drop it into this `public/fonts/` folder.

All four families are **SIL Open Font License 1.1** — free to download, self-host, and redistribute.

Direct specimen pages:

- Cormorant Garamond — <https://fonts.google.com/specimen/Cormorant+Garamond>
- Inter — <https://fonts.google.com/specimen/Inter> (or <https://rsms.me/inter/>)
- Newsreader — <https://fonts.google.com/specimen/Newsreader>
- IBM Plex Mono — <https://fonts.google.com/specimen/IBM+Plex+Mono> (or <https://github.com/IBM/plex>)

`server.js` already serves `public/` statically, so once the files are here, `/fonts/inter-400.woff2` resolves with no further wiring, and every machine — online or offline — renders the real brand faces.
